ACADEMIC MINI PROJECT

Web Development
Mini Project Proposal

FoodieHub

Online Food Ordering and Delivery Platform

A user-friendly platform to explore restaurants, browse menus, place food orders, and track delivery.

NAME	A. Revanth Kumar
ENROLLMENT NUMBER	25CS003583
BRANCH	CSE (Cyber Security)
SEMESTER	3rd Semester

1 Project Statement

FoodieHub is a web application concept that allows users to discover nearby restaurants, explore food menus, add items to a cart, and place food orders online. It is inspired by the common features of food-ordering platforms such as Zomato.

The website aims to make ordering food convenient by presenting restaurant information and menu items in one place, with a simple flow from browsing to checkout.

2 Problem Statement

Customers may need to visit several restaurant pages or contact restaurants individually to compare menus and find suitable meals. This can make the ordering process slow and inconvenient.

FoodieHub proposes a single, organized interface where users can browse restaurants, review menu details, and prepare an order in a few steps.

3 Objectives of the Project

- To create a clear and responsive food-ordering website interface.
- To display restaurants, food categories, and menu items with prices.
- To allow users to add or remove food items from a shopping cart.
- To calculate the order total and display an order summary.
- To provide basic search and filtering for restaurants or food items.
- To demonstrate practical use of HTML, CSS, and JavaScript.

4 Proposed Solution

The proposed website will contain a homepage, restaurant/menu listings, and a cart or order-summary section. Users can browse available food items, add selections to the cart, adjust quantities, and review the total before submitting a sample order.

For a basic academic prototype, restaurant and menu data can be stored locally in JavaScript or browser LocalStorage. Online payment, live delivery tracking, and real restaurant integrations are outside the scope unless added later.

5 Key Features and Functionalities

- Homepage with project introduction and featured food categories.
- Restaurant cards with restaurant names and sample ratings or details.
- Menu display with food names, descriptions, and prices.
- Search or filter option to find food items or restaurants.
- Add-to-cart, remove-item, and quantity-update controls.
- Order summary showing subtotal and estimated total.
- Basic form validation and a sample order confirmation.

6 Proposed Technologies

HTML5	Structures the pages, forms, menus, and content.
CSS3	Provides layout, colors, responsive design, and styling.
JavaScript	Handles search, cart updates, quantity changes, and calculations.
LocalStorage	Can preserve cart or demo data in the browser.
Visual Studio Code	Used to write and edit the project files.
Git and GitHub	Can be used for version control and source-code sharing.

7 Application of Web Development Concepts

- HTML elements will organize restaurant listings, menu items, and forms.
- CSS will create a consistent, mobile-friendly interface.
- JavaScript event handling will support cart interactions and dynamic totals.
- Form validation will check required user details before a sample order is submitted.
- LocalStorage may be used to retain cart information between page refreshes.
- Basic accessibility practices will support readable text and clear controls.

8 Expected Outcomes

The expected outcome is a working front-end prototype of FoodieHub. Users will be able to view sample restaurants and menus, search for items, add food to a cart, change quantities, and see an order total. The project will demonstrate the use of HTML, CSS, JavaScript, and browser storage in a practical web-development scenario.
